The main purpose of this document is towards creating a catalogue of the archaeological artefacts that are stored at the Powell Cotton Museum, Birchington, Kent.

This one covers the Bronze Age and Early Iron Age artefacts excavated on the foreshore of Minnis Bay by Antoinette Powell-Cotton.

The periods covered are:

- **Early Bronze Age** (EBA) 2200 - 1550 BC
- **Middle Bronze Age** (MBA) 1550 - 1350 BC
- **Mid to Late Bronze Age** (MBA-LBA) 1350 - 1150 BC
- **Late Bronze Age** (LBA) 1150 - 1000/900 BC
- **Earliest Iron Age** (EIA) 1000/900 - 600 BC
- **Early to Mid Iron Age** (EMIA) 600 - 350 BC

To provide a fuller understanding we have aimed to put this information in the context of the occupation and the subsequent archaeology of Minnis Bay, Kent. To this end we have included artefacts and relevant archive material held elsewhere including the important Bronze Hoard at the British Museum and the early archive records at the Maidstone Museum.

To assist in understanding the archaeological progression of the site, we have subdivided this document into the following sections:

- **introduction** page 2
- **Section 1** ‘The Bronze Age Site’ page 3
- **Section 2** Pits & Artefacts of ‘The Bronze Age Site’ page 17
- **Section 3** Early Iron Age ‘Alphabet Pits’ & Artefacts page 49
- **Section 4** pit ‘N’ Artefacts & excavation Cells page 65
- **Section 5** Early Iron Age Pits & Areas to the West page 89

We wish to thank the following experts for their guidance and encouragement to produce what we hope will enable archaeologists and the general public to understand and have access to the PCM treasures.

- Inbal Livne, Head of Collections PCM
- Hazel Basford, Archivist PCM
- Pernille Richards, Registrar at Maidstone Museum
- Neil Wilkin, Curator of the British and European B A collection at the British Museum
- Nigel Macpherson Grant & Paul Hart for adding credence to our entries.

Finally, we must state our appreciation to Antoinette P-C [Tony] who introduced us in 1965 to her enthusiasm for the archaeology of Minnis Bay. We are delighted to have returned as volunteers to use our background knowledge of how Antoinette worked and our ability to decipher her writing that has uncovered some amazing facts.

Vera & Trevor Gibbons 2017
**introduction**

**The Bronze Age Site and Early Iron Age pits on the foreshore of Minnis Bay, Birchington.**

In April of 1938, James Beck, a resident of Birchington and a Scholar at King’s School, Canterbury, aged 14 years, found a series of 8 holes sunk in the chalk on the foreshore of Minnis Bay, Birchington, which were covered at high tide. Seven of the holes proved to be the bottom of Late Iron Age shafts or wells.

In the August of the same year, young Beck, becoming bored with the Late Iron Age pits, wandered further west along the beach where he found a pit or hollow near the remains of the ‘Hero’, shipwrecked in 1895. The pit contained a large quantity of animal bones and one human bone. He was about to give up when he came across a small piece of a bronze knife. This encouraged him to dig further. He found a bronze celt soon followed by more celts, palstaves, dagger points, bracelets, swords, bronze tools, a bone arrowhead and a quantity of pottery sherds. Also found on the site was a large amount of wood, all well preserved in the clay filling of the area. The wood included collapsed wattle ‘fencing’, posts arranged in a curve and other individual posts. As the local museum proprietor, Major Percy Powell-Cotton was approached for advice and recognizing the importance of the hoard he brought it to the attention of the British Museum. Throughout the summer Jimmy Beck, with his friend Robert Grace continued to investigate the ‘Bronze Age’ area. In September 1939 the unique hoard was loaned to the British Museum, with the request it should be known as the ‘The Beck Find’. About the same time Maj P. P-C, with the assistance of his curator G F Pinfold commenced a report of Jimmy Beck’s work at Minnis Bay with a full description of the hoard, subsequently accepted by the Kent Archaeological Society [Archaeologia Cantiana Vol. LI p191.]

Frederick Henry Worsfold, a local historian, became aware of the discovery of this significant ‘Bronze Age’ site. In March 1939 he also approached the British Museum and invited Christopher Hawkes, then an Assistant Keeper, down to Minnis Bay to assess the site. Hawkes immediately realized the BM would be unable to mount a formal dig, as excavation was always dependent on the tides and weather conditions to expose the site. He suggested to Worsfold that, being local to the area, he should try to gather a team together, consisting of young Beck, Grace, F. B. Byrom and Roy Carr, both amateur archaeologists, and other volunteers to work when the conditions were favourable. Hawkes gave his support by offering to put Worsfold in touch with any experts that were required to analyse their findings. He also agreed to make observations on any report that Worsfold may write. A paper was eventually produced, ‘A Report on the Late Bronze age Site excavated at Minnis Bay, Birchington, Kent, 1938-40’ by F.H. Worsfold, published in ’The Proceedings of the Prehistoric Society’ vol.IX 1943 p28.

The excavated artefacts were sent to the BM to be with the Beck bronze hoard.

All other records of the dig are at the Maidstone Museum archived as ‘The Worsfold Papers’.

In 1955 Antoinette Powell-Cotton, the youngest daughter of Maj P P-C, re-visited the site excavated by the Worsfold team. She completed the work that, due to the outbreak of war in 1939, could not be fully accomplished. This work included re-opening the Beck Hoard site where she found a few extra artefacts missed in the original excavation, which she sent to the B.M. to be added to the Beck collection. All other finds are stored at the Powell-Cotton Museum.

A P-C additionally found a series of Early Iron Age pits in a line running southeast from the BA site along the clearly defined eastern edge of the original Goresend Creek. These pits were coded as the alphabet pits. The first of these pits, pit A or ‘orange pit’ is that labelled by Byrom as the orange pit on his plan, 54yards to the southeast of the Hoard site. A few of the early alphabet pits on the east bank, some being hollows without finds were re lettered as satellites of an adjacent significant pit. Others were located on the west bank of the original creek and beyond towards Reculver.

In 1967 A P-C decided to measure the ‘Bronze Age Site’ again as she felt that the pits appeared to be much smaller than she remembered from 1938, when she assisted Jimmy Beck. In 1972 the original survey and this second survey were overlaid to the same scale, which showed that A P-C’s suspicions were correct.
In 2017 two interesting letters, dated 1970, were found in the PCM’s extensive archives. These letters were addressed to Ronald Jessop following the publication of his book ‘South East England’ in that year. Jessop passed the letters to Antoinette Powell Cotton knowing her involvement at Minnis Bay.

The letters were from E.H. Newcome Wright, who explained that in 1932/33, when he was 14-15 years old, he had an interest in archaeology. In the summer, when there was a very low tide, he saw some men, possibly ‘Fathers-on-holiday with their families,’ digging some 300 yards from the shore out beyond the 1895 wreck of the “Hero”. The letter continues:

The main site on which the men worked comprised a series of hollows some large (8 feet across?) some smaller in the rock area. In at least one of these, perfectly preserved woven wood ‘floors’ – I was so told they were – came to light. I recall my astonishment at seeing even the bark on the wood, which appeared to me to be cherry, as I thought, or possibly willow. It looked to me exactly like the woven hurdles then to be seen on the marshes between Birchington and St. Nicholas erected to provide shelter for the sheep. I was told by one of the men that bronze tools and an axe (axes) had been found and I myself saw the men find two or three bronze ‘needles,’ or now I think more probably large pins, from between the weave of the woodwork.

For my part I was told to work at the edge, or rather told to get out of the way, so that the edge was as near as I could go without risking a thick ear! It was however rewarding. All along the perimeter of the site where the sand ended and the rocks began I uncovered what even I recognized to be a low protective bank to the site as if what now formed the sands of Minnis Bay had then been lower, probably marshy land. I uncovered the bank to a depth of some 18” and of some 6’ or more in length. It sloped at about 45 degrees and what has always stuck in my memory is my amazement at its apparent construction. It appeared to me to be made of tamped chalk faced with broken flint and put me in mind of the appearance of many Kent churches, old farm buildings and walls. It remained firm and solid leading me to think that there must have been a good depth of each flint behind its black outer face driven into the chalk.

Newcome Wright’s reason for writing to Jessop was to ask his opinion as to whether what he had seen and found could be a new Bronze Age site in Minnis Bay. Jessop deduced from the information given, that the pits in question were part of the Beck site, much to the disappointment of Newcome Wright.

This revelation by Newcome Wright preceeded the find of Jimmy Beck’s Bronze Hoard by 5-6 years but no record of the finds made at the time exists. A P-C had however excavated a hollow, Pit K, in 1961. This pit was 300 yards from the shore out beyond the wreck. Finds included one small black rim sherd with herringbone decoration. A P-C established that this sherd was similar to one illustrated in E. Cecil Curwen's book, ‘The Archaeology of Sussex’, (page247, fig 79, 1938)
Early Bronze Age Pit K

Excavated by A P-C. Jan 1961 as pit K
Location: Minnis Bay, east side of creek, north of wreck Hero. Coincides with location referred to in correspondence confirming excavated by others in 1934.

Diameter 5ft . Depth about 2ft - 2.5ft straight sided.

Field book A.P-C [book13 pages2 & 3]

Mon 23 Pit K depth 2'-2 1/2', 5' dia: straight sides. .........

Tue 24. Collected a few little bits of bone & one black rim sherd with decor + herring bone \ /of finger (?nail) or stab - looks more M.B.A. or E.B.A but not made with string -? shell grit & one bit red "grit" -?crushed pot? haemattite? ?
The decor showed up better semi washed when the incisions were filled with white /chalk - but in brushing this came off - .
As the sherd was smeared with mud not buried with chalk (altho' mud was mixed with chalk) it may be white filling was part of decor. I think soot came off outside when washed - certainly v. dark brown ....
Wed 25 Jan.........v.cold washed bones in sea ready for bringing back. Think white filling of sherd decor, was only chalk............
.......No, thought again & believe it was intended decor.

Pot Arch.pitK.1 [PC310/1961]

Pot sherd rim with white markings. Unusual rusticated beaker.
Early Bronze Age fine flint with sparse shell 2000-1600BC
Flat-topped rim sherd, thick walled, from large diameter storage jar. Single row of horizontal fingernail impressions just below rim, with a subsequent horizontal bordered shallow recessed hollow showing 2 rows of diagonal fingernail impressions. Below this border are horizontal fingernail impressions and finger pinching, possibly part of a herringbone motif. Notably all of the fingernail impressions are infilled with a chalky paste. From a Potbekker. Similar to rusticated Beakers from East Anglia (cf. Bamford H. 1982. Beaker domestic sites in the Fen edge in East Anglia. East Anglian Archaeology 16, figs.).
[N Macpherson Grant 2016]
The Beck Bronze Hoard & Site in 1938

The finding of the Minnis Bay hoard in August/September 1938 by 14 year old Jimmy Beck and its subsequent excavation recovered 51 pieces of bronze, and many sherds. During these excavations Beck began to think that he had found the site of a Bronze Age fishing village built round an open space on the banks of the creek that once flowed out to sea at this point in Minnis Bay. Beck wrote an article on his find for his school magazine (Cantuarian p.54, vol. XII, No1, Dec 1938).

The following is the 4th paragraph of ‘Bronze Age Discoveries at Birchington’:

Whilst I was unearthing these bones, I happened to dig up a bronze knife. Only a small piece of knife, green with age, and as I cleaned it I thought I would have another try in the same place. So one morning I went down and began digging. I first came across a beautiful bronze celt, an instrument rather like an axe, used for cutting. There is a socket for a piece of wood to drop into, and an eye or handle, rather like a cup handle, but very small. This is for a piece of deer thong to be attached, and tied firmly to the wood. The next day I came across another. I dug further down, and came across many more bronze things. Amongst these were celts, palstaves, dagger points, bracelets, swords, armour, gouges, shears, knives, shield discs, and a bone arrow head. Besides these bronze weapons, there was pottery in quantities. Bronze age pottery is not, as one might think, a beautiful vase made in bronze. The pottery is very rough and uneven in thickness. It is usually black or grey and rather small. From Birchington, there was unearthed some most beautiful pottery. One vase was about one and a half feet high, black and very thick. Most of the other vases are small and cup-like. That means they are round and not much larger than an ordinary cup.

Jimmy Beck produced an early plan [opposite page] locating the further pits of the Bronze age site and the location of the hoard find. As previously stated during this time he was helped by his friend Robert Grace, who also later produced his own rough plan. Unfortunately a different sequence of pit coding was used. However both plans coincide with the later accurate Byrom drawings in confirming the layout of the Bronze Age site, and a description of the terrain. The alphabetic sequence on these BA plans should not be confused with A P-C’s EIA pits.

Beck had already located 16 pits or hollows where BA artifacts were found before the team began excavating. A further seven new pits adjacent to the hoard site were added to Beck’s list. It appears that Worsfold left the task of recording the dig to Byrom, who wrote it as a dig diary. The excavation began on 10th June, 1939 and ends on the 23 August, 1939. The pits were excavated over 19 days. Byrom recorded the names of the participants each day as well as recording the finds. He also produced drawings of the pits. Samples were taken by Worsfold for analysis by experts recommended by Hawkes.

Some of the pits were only shallow depressions being at the most 1’ 0” in depth, with one pit being 4’ 0” deep. The size of the pits ranged from 42’ 0” x 24’ 0” across, to 2’ 6” x 3’ 0”. The shallow nature of some of the pits probably meant that they had been eroded over the years, as in 1939 pit BA 11 measured 12’0” in diameter which had been reduced to 9’ 0” by 1967. Several of the pits had a common profile. The sides were vertical and the base was level over part of the pit with a section sloping up to the top edge.

As the excavation progressed the team was surprised by a freshwater spring appearing 1.02 feet below O.D. on the upper edge of the gravel bank about 12’ 0” from the hoard site.

Byrom 1939 sections

V&T Gibbons 1967 [digitised 2017]
1939 section of Bronze Age site by Worsfold team.
Work on the site finished in late August, the week before war was declared on 3rd September, 1939. Worsfold set about the task of collating all the information recorded in Byrom’s notes together with any photographs taken by him or any other helpers. His subsequent report laid out all this information together with his own interpretation of the site. He then sent the finished report, drawings and photographs to Hawkes for his consideration in early 1940. Hawkes replied, after some delay, saying that the ‘big volume of typescript and beautiful album of pictures have the material so fully set out, that there has been a lot to digest.’ and he had spent time assessing it in order to do it justice.

Hawkes on reading the report found the plans and sections of the site a little confusing but he was able to put forward the theory that the site was developed in two stages by the same people in the Late Bronze Age. The first period ended when the site was flooded leaving the clay silt behind. The site was then re-occupied and the gravel bank, in which the Bronze Hoard was found, was built. Hawkes continued that a flooring of rammed chalk was laid but most of it had been scoured away by the sea. At some point the sea completely flooded the site again causing it to being abandoned about 600 B.C. He concluded that the occupation was originally on dry land and ended as a wet pile settlement. This would give ‘a very close date to the subsidence which caused the flood and to the further subsidence which drowned the site altogether.’ Hawkes put a date as being about 750 – 700 B.C. or 750 – 650 B.C. which is also borne out by the earliest pottery found as being Continental in type and the socketed sword found in the Bronze Hoard typical of slightly later British developments.

This theory of the development of the site Hawkes realised did not agree in ‘several important respects as well as in detail’ with what Worsfold had expressed in his initial report. Hawkes agreed that the first settlement was on dry land was correct for the first period and that the pits dug were not basements for little huts but as pits for storage etc., as at Little Woodbury, Scarborough and All Cannings Cross. He saw the large pit 15 as a working hollow for the threshing of grain as at Little Woodbury and the remaining timber work as buildings belonging to the second period, over-sailing the earlier pits and independent of them. What did remain of the timber did show that oblong or rectangular buildings did once exist. Hawkes was also sceptical about the horizontal wattle-work being flooring. He saw it as ‘fallen wattle walling, as at Glastonbury Lake village.’ He also pointed out that Worsfold had made assumptions that were not backed up with proof although he did not say exactly which points they were.

Throughout his analysis Hawkes emphasizes that these were his considered opinions and that they were ‘solely to help make the published account worthy of the devoted labour you all put in the actual work of excavation.’ He had also made a caveat in his analysis that it may be cut quite heavily by the editor as space was at a premium due to the wartime paper shortage. This did happen (see Proceedings of the Prehistoric Society 1943) and was a great disappointment to Worsfold who felt that the published article did not fully reflect his original report.

The above information is from correspondence between Worsfold and Hawkes, amongst ‘The Worsfold Papers’ in the Maidstone Museum archives.

Pit BA 11 [Beck pit G? Grace pit F]
Excavated by Jimmy Beck in 1938 as pit G? and by Worsfold team in 1939 as pit11 by A P-C. Apr 1959 as pit BA 11.

Ref Field Bk 6.p.35 Bk 10 p.17, 19.
Size: 9 feet diam A P-C. 1966

Aug 21-23 FBB

Hole -11 stripped
Diameter about 9 ft. Depth up to 1 1/2 ft.
Eastern edge vertical. Western sloping.
Patchy disturbance at various points.
Floor - chalk. Filling - grey silt & occasional lumps of chalk and flint.
Contents Bones. Fairly numerous, mostly small, but one small ox head. Several tibiae femora shaped into picks
Flints. one or two possible picks
Woodwork. stakes and cross beams at shallow end.
Rush work. Patches of 1/2” thick brown matted rush, largest about 1’ square all over, especially in E. half.
mostly about 6” deep.
Pottery (1) Rim of a large shallow bowl with a good lip
(2) Rim of ditto without lip
(3) A bowl smashed into hundreds of fragments. Made of greenish very soft pottery & apparently containing a mass of greenish white paste.
Stone. A slab of stone with a smooth slightly curved surface structure - grey hardstone identical with that found in main area.

LBA/EIA Pit BA 22

Pit BA 22 also referred to as ‘N W of Stoney’
Excavated by Worsfold team [stripped by Byrom & Carr]
Aug 1939 as pit 22 surveyed mid 1960s by A P-C. as pit BA 22.

Size: about 10 feet diam.

Saturday & Sunday Aug 12 & 13  FBB & R Carr
Hole marked 22 on chart explored.

Saturday  Eastern half stripped. A saucer like depression nowhere more than about 1’ deep full of silt flecked with chalk marbles.
Contents various bones including a ? small ox skull. no pottery discovered.
Woodwork, The N.E. lip of the saucer shows a complex network of wooden strips; several layers embedded in tough granular chalk & flints (photo)
No obvious pattern apart from one long strip which runs round the circumference. The N.W. corner has a very stout pole going deep into the chalk and wedged with flints.

Sunday  Remaining half stripped. Nothing but odd bones in Southern quarter. One central pole in chalk & other horizontal ones.
In N. corner a E-W baulk of 6” timber.
Removed & photographed underneath an excellent shallow bowl in many fragments.
See diagram

**EIA/EMIA Pit Q** [also some Roman]

**P**

*Excavated by A P-C. 1955-60 as Q, with satellites Q1 to Q6.*

**Ref** Field Bk2. p. 17-37  
Bk11. p. 50-60  

Pit contains high proportion of residual flint-tempered pottery probably, but not certainly, entirely of first millennium BC date. In addition the Conquest-period AD material is also worn and residual in-context. The more complete and less worn ER>MR elements have dates spanning c.125-250AD. An infill date between c.175-225 Ad is likely.  
[N Macpherson Grant 2017]

*Scale section of pit Q. (5 feet wide)*  
Surveyed 1960. [Drawn for publication]

---

**Pot Arch.pitQ. 5** [IOTAS2:295+]

Pot sherds [31]  
Early Roman Verulamium region white-ware.  
Near complete flagon, with neck and rim and handle missing, worn handle scar on upper shoulder. Soft, friable cream sandy fabric containing fine ironstone inclusions.  
Source uncertain.  
[NMG]
Pit Q continued

Pot Arch. pitQ. 1 [IOTAS2:295+]
Pot sherds [51]
EIA>EMIA+ flint tempered 950-350BC
Combined pieces from ‘Q’, ‘Q2’ and ‘Q6’.
Mostly small sized, but some moderate sized, heavily worn body sherds and scraps.
EIA>EMIA span (at least). Includes at least 1 probable EMIA rusticated sherd. [NMG]

Pot Arch. pitQ. 2 [IOTAS2:295+]
Pot sherds [4]
LIA-MR coarsewares 50-200AD
From ‘Q’ and ‘Q6’. Mix of LIA>MR coarsewares. Small, moderately worn sherds of Thanet silty (?charcoal inclusions), North Kent fine grey, Kentish sandy, probably NCW with white slip. [NMG]

Pot Arch. pitQ. 4 [IOTAS2:295+]
Pot sherds [16]
Mid Roman Kentish grey sandyware 175-250 AD
Base of a grey sandyware jar, slightly worn, hard fired.
[NMG]

Pot Arch. pitQ. 3 [IOTAS2:295+]
Pot sherds [69]
Early Roman N Kent fine grey 150-200AD.
Mostly small to moderate sized, with 1 large sherd, all same vessel. Complete profile, no exact parallel, but related to a Monaghan 1987 Type 4A1 and 4A2 S-profiled bowls: Type 4A beginning 50/75 AD and merging with type 4A2 during 2ndC, continuing to early 3rd.

Pit N
Excavated by A P-C. 1955 - 1970 as pit N and N1. Merged and dug as cells.

Ref Field Bk3 p.40-48.
  Bk6 p.1-2
  Bk20 p.2-12
  Bk21 p.4-15
  Bk22 and Bk23 p.16-17

Pit N Contains multiple excavated ‘cells’ and more generally located material. Majority EIA, with various wear patterns, with fresh and more worn material. 1 part profile from an unusual sub-fine ware. Some decorated sherds show a chalky infill which pre-dates subsequent overlying sooting deposits. The chalky infilling need not be intentional however and may have occurred post-discard, the sherds gaining their chalky fill from a chalky solution within the pit and subsequently subject to a fire within.

NB. Includes 2 fresh, 1 slightly worn and 1 more heavily worn sherds from a rusticated coarseware vessel/s. These could be contemporary (pers. comm. Peter Couldrey), if not a later intrusion. Most of the red finished sherds (fine ware bowl sherds; all analysed by the British Museum) are coming from the sea edge and north east edge. 1 sherd of organic tempered ware very worn and possibly 7th C AD Saxon and intrusive. Notably 2 fresh conjoining sherds from a MBA coarseware vessel, unique in context. Also 1 fairly fresh sherd from a ?North French/Flanders EM vessel, intrusive.

The impression gained from the fill of this pit is that it contained a fairly high quantity of small sized, sometimes very abraded body sherds, which could suggest an initial deposition of ‘sweepings’ that pre-date the arrival of the fresher elements. The latter comprises at least 1 near complete coarseware jar, the greater part of a fine ware highly decorated bowl and 2-3 other part profiles of coarsewares, all of which are near fresh and may represent the latest arrivals, suggesting the pit could have been open for some time. There is however no guarantee that the fairly fresh vessels were the latest element to be deposited within. Although dated here between 950 and 750 BC on the basis of radiocarbon dates from the recent Cliffs End Farm excavations (Wessex Archaeology), the presence of red finished pottery could, technically, suggest a date after 900 BC.

(cells 13-10 oak baulk from east. Deepest groove in rotten oak baulk.)
Pot Arch.pitN. 2 [IOTAS2:574+]
Pot sherds[114]
EIA Fine sandy plus sparse flint plus chalk inclusion. 950-750 BC

Mostly small to moderate sized sherds, including 1 fairly large sherd, all from an everted rim fineware bowl or jar; rim internally bevelled, with sharp inner rim angle. This vessel burnished externally and internally and decorated (on exterior) with neatly incised 3-line chevrons above shoulder, with horizontal aligned elongated chevrons below shoulder, which are spaced around the body and individually filled with comb tip impressions (full comb length 3-4cm long). Some sherds with the incised lines and comb tips are filled with a chalky residue, possibly deliberate, but more probably a by-product of contact with pit sides and a chalk solution. 1 decorated sherd shows a chalky infill which pre-dates subsequent overlying sooting deposits; this sherd is slightly worn. 1 other sherd with decoration is very fresh and shows no chalky infill. The chalky infill present on the other might thus be post discard. There is a marked difference in condition (some are very highly worn, others near fresh), suggesting differential coverage once disposed of. The basic chevron design is similar to a design from Highstead Period 2 and Monkton Court Farm (1992).

[N Macpherson Grant 2017]
Pot Arch.pitN. 4 [IOTAS2:598+]  
Pot sherds[28]  
EIA fineware body sherds, mostly small sized, variable condition. plain. flint tempered 950-750 BC [NMG]

Pot Arch.pitN. 5 [IOTAS2:575]  
Pot sherds[14]  
EIA undecorated fineware sherds. Small to fairly large sized. Rims, bases, shoulders, including an elegant thin-walled angle shoul-dered bowl. Large part profile element is fresh. flint tempered 950-750 BC [NMG]

Pot Arch.pitN. 6 [IOTAS2:575]  
Pot sherds[7]  
EIA coarseware rim, shoulder and base sherds, all fairly small. Includes 1 from a thick-walled jar with traces of horizontal fingertip decoration. 1 base sherd with skin of profuse flint grits. Slightly worn to near fresh. flint tempered 950-750 BC [NMG]

Pot Arch.pitN. 7 [IOTAS2:575]  
Pot sherds[85]  
EIA small to moderate sized coarseware body sherds, variable wear patterns. Includes 1 re-fired. flint tempered 950-750 BC [NMG]
Pit N cell group 14/15/17

Pot Arch.pitN.16 [IOTAS2:582]
Pot sherds [33]
EIA small to moderate sized coarseware and fineware sherds, variable wear patterns. 2 fairly large near fresh. 1 small fragment from a fineware bowl with an omphalos base. 1 lightly refired and 1 heavily refired coarseware sherds. Flint tempered 950-750 BC [NMG]

cell 14 twisted root above hard baulk

Pot Arch.pitN.23 [IOTAS2:610]
Pot sherds[12]
EIA small to fairly large sized elements, various flint tempered fine and coarseware rim and base sherds, including 2 with diagonal fingertip and fingernail impressions on the shoulders. Fresh to slightly worn, flint tempered 950-750 BC [NMG]

Pot Arch.pitN.24 [IOTAS2:610-611]
Pot sherds[7] in 7 bags
EIA red finished fine ware shoulder sherd. NMG catalogue no. C111. Flint tempered 950-750 BC

EIA sherd Red finished fine ware 10g. Body sherd, slightly chipped. BM Department of Scientific Research no. 35812W. Thin sectioned. Flint tempered 950-750 BC

EIA sherds[2]. Red finished fine ware 4g. Body sherds. BM nos. 35810P (thin section) and 35811Y. Flint tempered 950-750 BC

EIA sherds[3]. Red finished fine ware 27g. Shoulder sherd from a remarkably concave necked angle shouldered bowl. 2 conjoining. Heavy unifacial external abrasion. BM nos. 35815Q, 35816Z and 35817X. Flint tempered 950-750 BC. [NMG]

Pot Arch.pitN.25 [IOTAS2:666]
Pot sherds[2]
Middle Bronze Age 'North east edge'. 92g. Conjoining, forming a fairly large unit from rim and upper body of an MBA type bucket jar, heavy coarse flint tempering, but thin walled. Slightly chipped, otherwise near fresh. Decorated externally below rim with single horizontal line of spaced fingertip impressions, with 2 vertical lines of similar descending from latter downwards - ?1 of several groups of such decoration distributed vertically around the body. Decoration similar to example from Bon Secours Ramsgate (BSE03) and also similar to a number from Ardleigh, Essex (Brown N.R. 1999. Archaeology of Ardleigh, Essex. Excavations 1955-1980. East Anglian Archaeology, Report no. 90. Figs 55-81). Unique in this context. Flint tempered 1550-1350 BC. [N Macpherson Grant 2017]

LBA/EIA Pit U

Pit U
Excavated by A P-C. 1966 - 1971 as pit U and U1
Location: Minnis Bay, west side of creek, south of wreck Hero. 100yards off promenade.

Ref Field Bk17. p.111.
Bk23. p.57-69, 71-86

Majority of the material is (flint tempered) briquetage, some showing finger wiping (predominantly horizontal, but also appearing vertical) and knife trimming. Other sherds from a couple of vessels are also present. Pit contains fairly large quantities of elements from briquetage evaporation vessels, including body sherds, knife trimmed tops and ends and base angles. Overall the assemblage includes both worn and mostly near fresh elements, of small to frequently fairly large size. Also present are a small quantity of elements from pottery vessels which were either used in the salt making process or had been contaminated by said process. The horizontal and vertical fluted finish on many of the briquetage vessels is similar to those from a broadly contemporary assemblage at St. Mildred's Bay, Thanet. [N Macpherson Grant 2017]

page 98
**EIA/MIA Pit/Area P**

**Pit P**

Excavated by A P-C. 1967-72 as P creek & P area. Also 'north west of P', being an EIA area close to the Brookesend Stream and wet of the offshore sewage pipe. Much human as well as animal bone was noted. This was investigated in 1971 but not fully excavated.

To the north-west of pit P an unusual human burial was excavated, bones included four scapula and seven and a half pelvis packed and wedged by two large flints and a triangular sandstone fragment into a horse pelvis which was in two halves.
